

## Diesel Emissions Standards Factsheet

Emissions Standards are used to classify non-road diesel engines into Tiers based on particulate matter (PM) emission rates. Metro Vancouver's [Non-Road Diesel Engine Emission Regulation Bylaw No. 1161, 2012](#) (the Bylaw) has based approved emission standards on [US Environmental Protection Agency](#) (EPA) and [European Commission](#) (EC) emission standards for non-road diesel engines (Tier 1 to Tier 4) and emission factors developed for Tier 0 engines, by the [California Air Resources Board](#) (CARB).

The EPA implemented the first non-road diesel engine emissions standards (Tier 1 engines) in 1996. This established emission rates for new non-road engines built for use in the United States. Canada introduced the [Off-Road Compression-Ignition Engine Emission Regulations](#) in 2005 to establish emission standards for diesel engines used in off-road applications for 2006 and later model year.

Engines manufactured for use in Canada, the United States or European Union before 1996 are referred to as Tier 0 engines. Please note that engines manufactured for sale in other markets are considered Tier 0 engines, unless the emissions can be demonstrated to meet a higher Tier.

The table on the next page entitled, "Metro Vancouver PM Emission Standards" presents the bylaw's approved emission standards for Tier 0 to Tier 4 non-road diesel engines. These standards are used to determine:

- Engine Tier classifications,
- Registration fees for Tier 0 and Tier 1 engines, and
- Fee reductions and refunds, when an engine is upgraded using an approved emission reduction measures (ERM).
