

## 148 STREET WATER MAIN PROJECT

# What are Valve Chambers?

Valve chambers play a very important role in how Metro Vancouver delivers drinking water to your municipal system. Typically constructed underground, these chambers house pipe connections, valves and other electrical equipment used to regulate the flow of water through area mains. They also allow maintenance crews to isolate certain sections of the distribution system to conduct maintenance and repair work when required.

A similar valve chamber and associated above-ground structures will be installed for this project.
